

Color Concentrates Liquid Pigment for Nail Polish

JND Color Liquid Pigments for making color Lacquer, Nail Polish, are pre-colored liquid pigment.

They are not the finished nail lacquer. If you use them straight out of the bottle to paint your nails you will probably be unhappy. For one thing, they are just too strong in color and so will likely stain your nail. Secondly, the colors don't contain all the necessary ingredients to make an awesome finished product. They will chip off, or flake off or basically not do what you want them to do.

Mix Color Concentrates Liquid pigment with any of our nail polish bases to create a finished nail lacquer.

This is a concentrated liquid pigment which you add to a nail polish base. Ideas:

To Make a Jelly Polish: Fill your bottle with an uncolored nail polish base (Luster Base) and then add this concentrate, drop by drop. Add 2-6 drops to a regular sized bottle (15ml) or 1-2 drops to a mini bottles (5ml).

Make a full-coverage finished nail Polish from scratch! If you would like to make a finished nail polish using a this color as a base, mix as much as 1 part color base and 1 part uncolored nail polish base.

Side Note:

How do you use them? Here are some ideas:

Measure 1 part of your color into a container, and add 1 part of your uncolored nail polish base. Mix!

Example: 1 part J-Blue plus 1 part Luster Base. Mix, it will give you a finished Blue nail polish

There are about 100 drops in a mini nail polish bottle (5ml) and about 300 drops in a full size bottle (15ml). This gives you plenty of flexibility for using JND Color Liquid Concentrates as a single color, or as part of a blend of colors.

Example: Fill a 15 ml nail polish bottle LE barrel about half way with uncolored Luster Base. Add up to 30 drops of Color Liquid Concentrates (10 J-Blue, 20 I-Yellow). Top of the bottle with more uncolored Luster Base. Mix then you will have medium Green Lacquer.

If you are using the uncolored Luster Base, you can get more creative by adding shimmery micas or other effect pigments.

Example: Add about 2-2 /2% by weight.

Example: Fill a 15ml bottle about half full. Spoon in 4 small scoops of JND Green Mica, add 15 drops of Color K - Ivory Nail Polish Concentrate and 5 drops of Color A-Violet Nail Polish Concentrate. Mix and surprise you with a new finished lacquer

If you are using the uncolored Suspension Base for your glitter suspensions, here is what we recommend:

- The best weight of glitter added to a Suspension Base is 5-8% by weight. For extra light glitters you can add as much as 10%.
- Add some to give some color, but the least possible! Too much will weaken the suspending properties of the Suspension base and your glitter will start to sink. Basically add as little as possible, and for sure not more than 1 part Mixer to 10 parts Suspension Base.
- *Be sure to test before committing a large batch!*

Example: Fill a 15 ml bottle about half full, spoon 5 scoops of Red Microfine Glitter and 3 scoops of Hearts glitter. Add 10 drops of Glazed and 5 drops of Sweet & Hot and mix!

Change the color of a polish you already own! If you would like to alter or adjust the color of one of your commercial polishes, you can! Simply add one of JND Color Liquid Concentrates drop by drop and stir in between.
